

CRM Recommendation – Multi-Service Client Management

Executive Summary

The CRM should be **client-centric rather than service-centric**: create one master profile for each client and manage all of that client's services inside the same profile. Each service should have its own tasks, documents and accounting, while the system automatically provides a consolidated client-level view.

Core Structure

ONE CLIENT → MULTIPLE SERVICES → SERVICE-SPECIFIC TASKS & ACCOUNTING → CONSOLIDATED CLIENT REPORTING

Business benefit: This eliminates duplicate client records, keeps service operations and finances separated, and makes the client's complete position visible without manually combining records.

1. Client Profile

A client should be added only once. The master profile should contain common information such as client name, contact information, address, general notes, general documents, client status and overall activity.

- Each client must have a unique Client ID.
- Multiple services must be linked to the same Client ID.
- The system should help prevent accidental duplicate client creation.
- Updating common client information should update the master record.

2. Service Management

Within Client A, users should be able to add Service X, Service Y, Service Z, or any future service. Each service should operate as an independent workspace while remaining connected to the same client.

- Each service must have a unique Service ID linked to the Client ID.
- Service fields should include type, status, start date, renewal/end date, assigned team, notes and fee structure.
- A service can be activated, paused/on hold, or closed without closing the entire client.

3. Client & Service Status Definitions

Client Status

- **Prospect:** Potential client; services have not yet started.
- **Active:** Client is currently receiving at least one active service.
- **On Hold:** Client relationship is temporarily paused, but the record remains active.
- **Inactive:** No current services are active, but the client record is retained for history.
- **Closed:** Relationship has ended and the client is no longer being serviced.

Service Status

- **Pending:** Service has been approved/created but has not started.
- **Active:** Service is currently being provided.
- **On Hold:** Service is temporarily paused.
- **Completed:** Service has finished successfully.

- **Cancelled:** Service was stopped before completion.
- **Expired:** Service reached its end/renewal date and was not renewed.

4. Task Management

Tasks should be linked to the relevant service. Users should be able to view Service X tasks, Service Y tasks, Service Z tasks, or all tasks for Client A.

- Task name, description, assigned person, due date, priority and status.
- Notes, attachments, completion date and recurring-task capability.
- Filters by client, service, assigned person, status, priority and due date.

5. Accounting & Financial Tracking

Accounting must be maintained separately for each service while the CRM automatically consolidates the financial information at the client level.

Accounting & Reporting Requirements

5. Accounting & Financial Tracking – Continued

Each service should track invoices, invoice dates, due dates, amounts, payments received, payment dates, payment status, outstanding amounts and applicable adjustments/credits.

Service	Total Invoiced	Total Received	Outstanding
Service X	\$10,000	\$7,500	\$2,500
Service Y	\$12,000	\$6,050	\$5,950
Service Z	\$6,500	\$2,500	\$4,000
Total Client A	\$28,500	\$16,050	\$12,450

Calculation: Outstanding = Total Invoiced – Total Received ± Adjustments

6. Client-Level Financial Summary

- Show Total Invoiced, Total Received, Total Outstanding and Number of Services.
- Show a service-wise breakdown of invoiced, received and outstanding amounts.
- Clicking a service should open its detailed accounting records.
- Client totals must be automatically calculated from the underlying service records.

7. Documents & Activity

Documents and activity should follow the same client/service hierarchy. Users should be able to store client-level documents as well as documents specific to a particular service.

- Activity should record date, time, user and action performed.
- Examples: service created, task completed, invoice created, payment received, document uploaded and status changed.

8. Reporting & Search

- Client-level reports: client information, all services, financial totals, service breakdown, outstanding invoices and task status.
- Service-level reports: only information related to the selected service.
- Filters: client, service, assigned employee, status, invoice/payment status, date range and outstanding amount.
- Preferred exports: Excel, PDF and CSV.

9. Acceptance Criteria

- A client can be created once and can have multiple services.
- Each service has separate tasks, documents and accounting.
- Users can view information by service or for the entire client.
- Client-level financial totals update automatically when service-level records change.
- Closing one service does not close the entire client.
- Reports can be generated at both client and service level.

CRM UI Reference – Recommended Screens

The following visual references illustrate the recommended client/service structure and should be used as design direction. The exact colors and styling can be adapted to the CRM's existing design system.

Reference coverage: Client Profile Overview, Services Tab, and Service X detailed workspace.

Additional CRM UI References

Here are additional CRM UI references covering the main screens your team would need:

- **Client List** — one record per client with total services and outstanding balance.
- **Client Overview** — consolidated financial and operational summary.
- **Services Tab** — all services under one client.
- **Service Overview** — details, financial summary and recent tasks for one service.
- **Service Tasks** — service-specific task management.
- **Service Accounting** — invoices, payments and outstanding amounts.

Design principle: one client record should provide a clear path to every service, while each service remains operationally and financially independent.
